INSTRUCTION SET ARCHITECTURE

Mahdi Nazm Bojnordi

Assistant Professor

School of Computing

University of Utah

Overview

- Announcement
  - Sept. 5th: Homework 1 release (due on Sept. 12th)

- This lecture
  - Instruction set architecture (ISA)
  - RISC vs. CISC
  - Memory addressing
  - Instruction format

What is ISA?

- Instruction Set Architecture
  - Well-defined interfacing contract between hardware and software
  - Does define
    - The functional operations of units
    - How to use each functional unit
  - Does not define
    - How functional units are implemented
    - Execution time of operations
    - Energy consumption of operations

Example Problem

- Which one may be guaranteed by an ISA?
  - The number of instructions supported by processor
  - The number of multipliers used by processor
  - The width of operands
  - Sequence of instructions that results in an error
  - Sequence of instructions that results in lower energy consumption
  - The total number of instructions for an application program
  - The total amount of main memory (e.g., DRAM)

Example Problem

- Which one may be guaranteed by an ISA?

YES ◘ The number of instructions supported by processor

NO ◘ The number of multipliers used by processor

YES ◘ The width of operands

YES ◘ Sequence of instructions that results in an error

NO ◘ Sequence of instructions that results in lower energy consumption

NO ◘ The total number of instructions for an application program

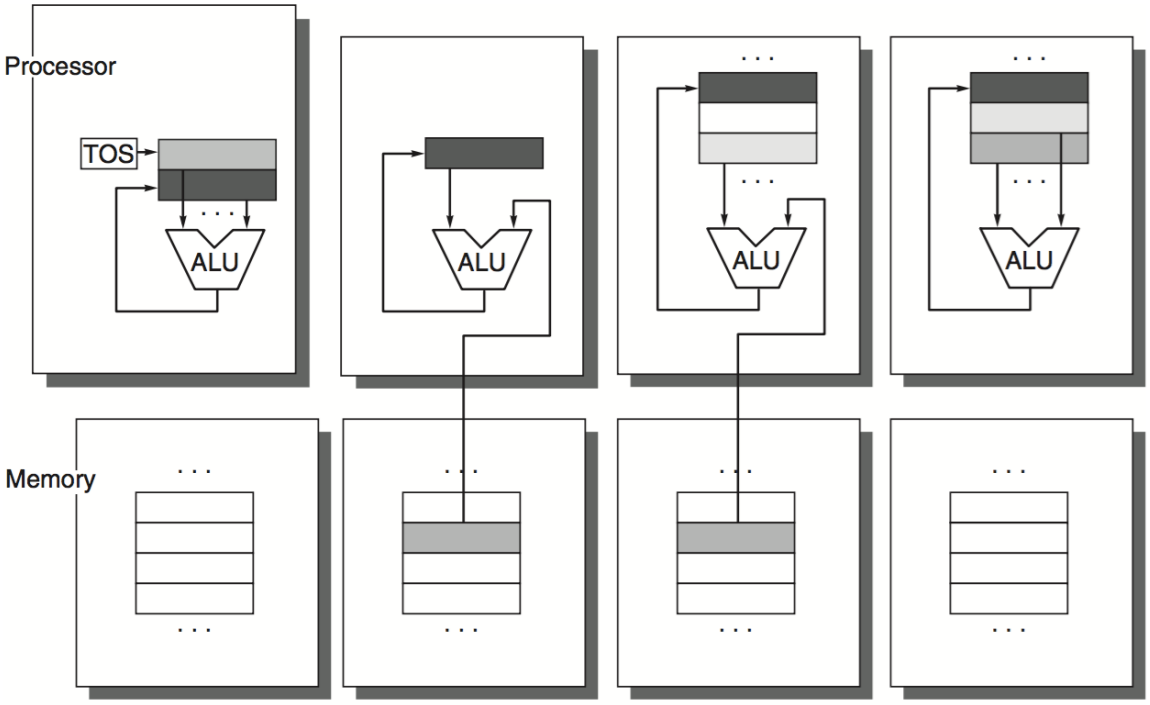
NO ◘ The total amount of main memory (e.g., DRAM)

ISA to Programmer Interface

- Internal machine states
  - Architectural registers, control registers, program counter
  - Memory and page table
- Operations
  - Integer and floating-point operations
  - Control flow and interrupts
- Addressing modes
  - Immediate, register-based, and memory-based

ISA Types

- Operand locations



Push A	Load A	Load R1,A	Load R1,A
Push B	Add B	Add R3,R1,B	Load R2,B
Add	Store C	Store R3,C	Add R3,R1,R2
Pop C			Store R3,C

Which Set of Instructions?

- ISA influences the execution time
  - CPU time = IC x CPI x CT
- Complex Instruction Set Computing (CISC)
- Reduced Instruction Set Computing (RISC)

Which Set of Instructions?

- ISA influences the execution time
  - CPU time = IC x CPI x CT
- Complex Instruction Set Computing (CISC)
  - May reduce IC, increase CPI, and increase CT
  - CPU time may be increased
- Reduced Instruction Set Computing (RISC)
  - May increases IC, reduce CPI, and reduce CT
  - CPU time may be decreased

RISC vs. SISC

RISC ISA

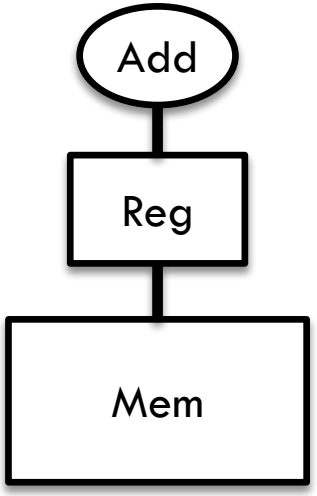
- Simple operations
  - Simple and fast FU
- Fixed length
  - Simple decoder
- Limited inst. formats
  - Easy code generation

CISC ISA

- Complex operations
  - Costly memory access
- Variable length
  - Complex decoder
- Limited registers
  - Hard code generation

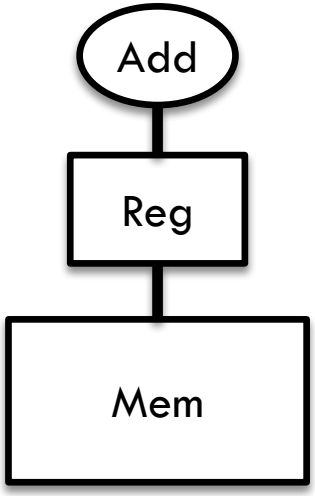
Memory Addressing

- Register
  - Add r4, r3
- Immediate
  - Add r4, #3
- Displacement
  - Add r4,100(r1)
- Register indirect
  - Add r4, (r1)



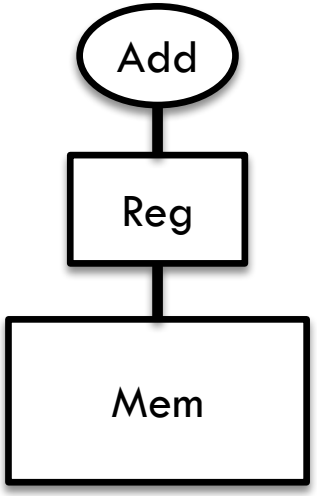
Memory Addressing

- Register
  - Add r4, r3 Reg[4]=Reg[4]+Reg[3]
- Immediate
  - Add r4, #3 Reg[4]=Reg[4]+3
- Displacement
  - Add r4,100(r1) …+Mem[100+Reg[1]]
- Register indirect
  - Add r4, (r1) …+Mem[Reg[1]]



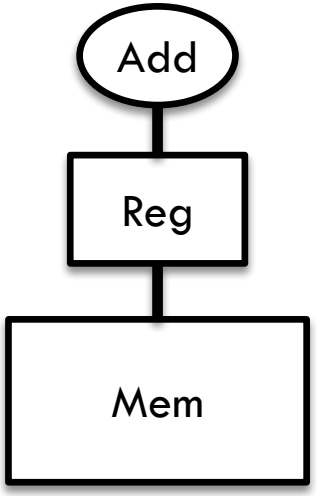
Memory Addressing

- Indexed
  - Add r3, (r1+r2)
- Direct
  - Add r1, (1001)
- Memory indirect
  - Add r1,@(r3)
- Auto-increment
  - Add r1, (r2)+



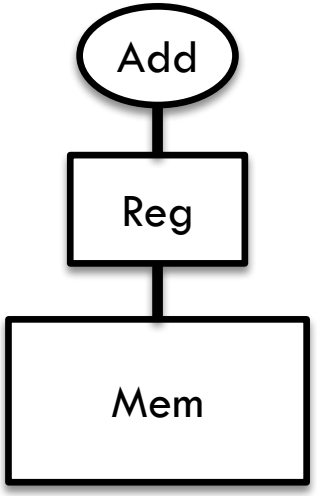
Memory Addressing

- Indexed
  - Add r3, (r1+r2)…+Mem[Reg[1]+Reg[2]]
- Direct
  - Add r1, (1001) …+Mem[1001]
- Memory indirect
  - Add r1,@(r3) …+Mem[Mem[Reg[3]]]
- Auto-increment
  - Add r1, (r2)+ …+Mem[Reg[2]]
  - Reg[2]=Reg[2]+d



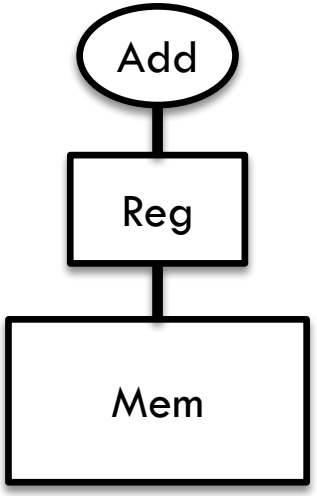
Memory Addressing

- Auto-decrement
  - Add r1, -(r2)
- Scaled
  - Add r1, 100(r2)[r3]



Memory Addressing

- Auto-decrement
  - Add r1, -(r2) Reg[2]=Reg[2]-d
  - …+Mem[Reg[2]]
- Scaled
  - Add r1, 100(r2)[r3]
  - …+Mem[100+Reg[2]+Reg[3] x d]



Example Problem

- Find the effective memory address
  - Add r2, 200(r1)
  - Add r2, (r1)
  - Add r2, @(r1)

Registers

r1	100
r2	200

Memory

…	…
100	400
200	500
300	600
400	700
500	800

Example Problem

- Find the effective memory address
  - Add r2, 200(r1)
    - r2 = r2 + Mem[300]
  - Add r2, (r1)
    - r2 = r2 + Mem[100]
  - Add r2, @(r1)
    - r2 = r2 + Mem[400]

Registers

r1	100
r2	200

Memory

…	…
100	400
200	500
300	600
400	700
500	800

Instruction Format

- A guideline for generating/interpreting instructions
- Example: MIPS
  - Fixed size 32-bit instructions
  - Three opcode types
    - I-type: load, store, conditional branch

    - R-type: ALU operations

    - J-type: jump
